# DECRUIZ LABS WHITEPAPER v2.0

## **Layer $\infty$ Protocol: The Unified Fabric of the Open Internet**

*"Not a bridge. Not a sidechain. A new continent."*

Publication Date: March 2026

Status: Live Mainnet (Phase 2)

Treasury: \$4.2M+

Community: 50K+

Cross-chain Latency: <1 second

ZK-Verified: Yes

# I. THE MANIFESTO

## The Great Fragmentation

In 2026, Web3 is broken — not in code, but in **courage**.

The blockchain industry has achieved a paradox: unprecedented infrastructure abundance has produced unprecedented user isolation. As of the second quarter of 2026, there exist over 150 active Layer 1 blockchains, more than 80 Layer 2 rollups, and approximately 78 billion dollars locked in cross-chain bridges. Yet, despite this proliferation, ninety-two percent of all digital assets never leave their native chain. A typical Web3 user maintains between twelve and fifteen distinct wallets. A gamer who earns a rare sword in one virtual world cannot use it in another. A DeFi investor who holds tokenized real estate on Ethereum cannot lend against that asset on Solana. A developer who builds a loyalty program on one chain must rebuild identity infrastructure from scratch when expanding to another.

This is not interoperability. This is an archipelago of walled gardens pretending to be an open internet.

The root cause is not technological immaturity — it is architectural fragmentation at the identity, asset, and governance layers. Existing solutions have failed to address these fractures holistically. Bridges introduce trusted third parties and have lost over \$4.2 billion to exploits since 2021. Wrapped assets are synthetic representations, not native ownership, and they fracture liquidity. Cross-chain decentralized exchanges ignore identity persistence. Multi-chain wallets provide no asset portability across application boundaries.

DeCruiz Labs was founded to end this era.

*“We are not building another bridge. Bridges connect two shores. We are draining the ocean.”*

## II. THE PHILOSOPHY

### One Ecosystem. Infinite Possibilities.

**Layer  $\infty$  Protocol** — the flagship infrastructure of DeCruiz Labs — is built on a single, uncompromising thesis: A unified digital economy requires unified identity, unified assets, and unified governance, not unified chains.

This thesis manifests in three core tenets:

#### 1. Identity Must Be Yours, Everywhere

Your wallet, your reputation, your KYC — they should follow you like gravity, not require re-entry at every border.

#### 2. Assets Should Be Borderless by Default

A gaming item, a DeFi receipt, and a tokenized building are all **economic objects**. They belong in the same liquidity pools, the same governance votes, the same portfolio views.

#### 3. The Community Is the Architect

No foundation, no corporation, no venture fund should decide which chain lives or dies. The DAO is the compass.

These beliefs become **Layer  $\infty$  Protocol**.

**Layer  $\infty$  Protocol** is the first production-ready system to treat these three tenets as first-class design requirements, not afterthoughts.

### III. LAYER $\infty$ PROTOCOL: THE ARCHITECTURE

#### The 5-Layer Stack

We have engineered a **modular, recursive, ZK-verified** stack. Each layer is independent yet infinitely composable.

| L1: APPLICATION LAYER          |              |                    |                  |              |
|--------------------------------|--------------|--------------------|------------------|--------------|
| dApps                          | Marketplaces | Gaming Clients     | RWA Dashboards   |              |
| L2: IDENTITY & WALLET LAYER    |              |                    |                  |              |
| WalletConnect                  | MPC          | DID/ENS            | Gasless          | Social Login |
| L3: CORE PROTOCOL LAYER        |              |                    |                  |              |
| EVM+ Smart Contracts           | DAO Module   | NFT Engine         | DEX AMM          |              |
| L4: RWA & ASSET BRIDGE         |              |                    |                  |              |
| Tokenization                   | Fractional   | Compliance Oracles | ZK Proofs        |              |
| L5: MULTI-CHAIN INFRASTRUCTURE |              |                    |                  |              |
| EVM                            | Cosmos (IBC) | Solana             | L2s (Arb, zkEVM) |              |

#### Layer Deep Dive

- L5: Multi-Chain Infra — **The Soil**

Native support for 10+ chains with zero-custody ZK-bridges. Not wrapped assets. Not synthetic proxies. **Native movement.**

| Chain Family                 | Integration | Status |
|------------------------------|-------------|--------|
| EVM (Ethereum, BNB, Polygon) | Native      | Live   |

|                    |                |         |
|--------------------|----------------|---------|
| Cosmos (via IBC)   | Native         | Live    |
| Solana             | SVM bridge     | Q3 2026 |
| Scroll (zkRollup)  | Native partner | Live    |
| Arbitrum, Optimism | Native         | Live    |

- L4: RWA & Asset Bridge — **The Scaffolding**

Where atoms meet bits. Real estate deeds, private credit, commodities — tokenized, fractioned, and made liquid.

**Key innovation:** Compliance oracles that adjust fractionalization rules per jurisdiction, without forking the protocol.

- L3: Core Protocol — **The Heart**

EVM+ (EVM with native ZK precompiles). Contains:

- **DAO Module:** Proposal lifecycle, treasury voting, grants.
- **NFT Engine:** Multi-utility, cross-chain portability.
- **DEX AMM:** Concentrated liquidity for all asset types (fungible + non-fungible).

- L2: Identity & Wallet — **The Face**

One user, one wallet, infinite chains.

Features:

- **MPC wallet** (no seed phrase)
- **Gasless onboarding** (pay gas in any token or via sponsor)
- **DID/ENS resolution** across all chains
- **Reputation layer** (on-chain scores for lending, governance)
- **Optional KYC** (for RWA compliance, zero-knowledge verified)

- L1: Application Layer — **The Hand**

SDKs for:

- Game studios (Unity, Unreal)
- DeFi platforms (lending, yield, launchpad)
- RWA marketplaces (fractional property, secondary trading)
- Social dashboards (portfolio view across 10+ chains)

### III. THE SIX PILLARS ECOSYSTEM

Think of these not as products but as **organs in a single body**.

| Pillar     | Function        | Creative Analogy                   |
|------------|-----------------|------------------------------------|
| Identity   | The passport    | A single face in every mirror      |
| GameFi     | The playground  | Items that dream beyond their game |
| Finance    | The bloodstream | Liquidity without borders          |
| RWA        | The skeleton    | Real weight, digital form          |
| Asset      | The hands       | NFTs as tools, not trophies        |
| Governance | The brain       | The crowd becomes the king         |

#### Pillar 1: Identity — **The Persistent Self**

**Technical implementation:**

- **WalletConnect v3** + embedded wallet SDK
- **MPC-TSS** (threshold signatures) — no single point of failure
- **DID method:** did:decruiz:<chain>:<address>
- **Reputation:** Scores calculated from transaction history, governance participation, collateral performance

**User story:**

> *Alice logs into a GameFi dApp with her Google account (gasless). Her DeFi lending history automatically boosts her borrowing limit across three chains. She never sees a seed phrase.*

#### Pillar 2: GameFi — **The Persistent Playground**

**Capabilities:**

- **Avatar NFTs** that retain traits across games
- **Land ownership** recorded on one chain, usable in any compatible game
- **Play-to-earn** rewards routed through unified treasury
- **Creator monetization** (royalties on secondary sales, even cross-game)

**Technical:**

- Game items are **ERC-1155 with a cross-chain pointer**
- State transitions verified via ZK-light client

**User story:**

> Bruno earns a "Dragon's Tooth" sword in Game A. He lists it on the DeCruiz marketplace, rents it to a player in Game B for 24 hours, then stakes the rental yield into a DeFi pool — all from one dashboard.

## Pillar 3: Finance — The Liquidity Engine

**Not a typical DEX.**

The DeCruiz DEX supports:

- **Token-token** (standard AMM)
- **NFT-token** (collateralized lending pools)
- **RWA-stablecoin** (real estate yield farming)

**Unique mechanism: Concentrated cross-chain liquidity** — a single LP position provides liquidity to pairs on three different chains simultaneously, with automatic rebalancing.

| Feature           | Description                                                   |
|-------------------|---------------------------------------------------------------|
| AMM pools         | Concentrated liquidity (like Uniswap v3)                      |
| Staking & farming | Incentives in native token + partner tokens                   |
| Launchpad         | Cross-chain token sales (raise on ETH, distribute on Polygon) |
| Swap aggregation  | Routes through DeCruiz + external DEXs                        |

## Pillar 4: RWA — Real Estate, Unlocked

**The market:** Real estate = \$326T asset class. On-chain RWA = <\$15B.

**The gap:** Illiquidity, fractional ownership friction, cross-chain incompatibility.

**DeCruiz solution:**

- **Tokenization engine:** Legal wrapper + NFT representation
- **Fractional ownership:** Down to 0.01% of a property
- **Rental yield distribution:** Automatic, verifiable, composable
- **Collateralized lending:** Use your tokenized apartment as collateral for a DeFi loan on another chain

**Compliance workflow:**

1. KYC / accredited investor check (ZK-verified)
2. Jurisdiction-specific fractionalization rules
3. Secondary trading only among verified wallets

## Pillar 5: Asset — NFTs with a Second Life

Most NFTs are **jpegs with a price tag**.

DeCruiz NFTs are **economic actors**.

**Multi-utility NFT standard (ERC-DeCruz):**

- Can be a membership pass, an in-game item, a governance ticket, and collateral — simultaneously
- Royalties enforceable across any marketplace that respects EIP-2981
- Cross-chain portability without wrapping (state is stored on Layer  $\infty$ )

## Pillar 6: Governance — The DAO Brain

**Not a token vote. An intelligence.**

- **Quadratic voting** to prevent whale dominance
- **Delegation pools** — stake your tokens to a specialist (e.g., "DeFi expert", "Gaming guild")
- **Treasury management** — \$4.2M controlled by on-chain proposals with 7-day timelock
- **Grants system** — community-reviewed, milestone-based

**Proposal examples (Q1 2026):**

- Add Solana bridge — passed
- Allocate \$500k for RWA legal structure — passed
- Reduce DEX fee from 0.3% to 0.2% — passed
- Integrate Scroll zkEVM — passed

## IV. TOKENOMICS: THE ECONOMIC ALGORITHM

The Native Token: `SDECR` (proposed name — not confirmed on site)

*Note: The website does not specify a token. This is a professional proposal based on industry standards and their DAO/treasury model.*

### Token Utility (Not Speculation)

| Utility          | Mechanism                                                 |
|------------------|-----------------------------------------------------------|
| Gas              | Pay for cross-chain transactions on Layer $\infty$        |
| Staking          | Stake to earn a share of protocol fees (DEX, RWA, bridge) |
| Governance       | 1 token = 1 vote (quadratic optional)                     |
| Collateral       | Stake `SDECR` to become a relayer or oracle               |
| Launchpad access | Priority allocation for token sales                       |

### Supply & Distribution

**Total supply:** 1,000,000,000 `SDECR` (fixed, no inflation)

| Allocation            | %   | Amount | Vesting / Notes                           |
|-----------------------|-----|--------|-------------------------------------------|
| Ecosystem & community | 40% | 400M   | Rewards, airdrops, grants — 4-year linear |
| DAO treasury          | 25% | 250M   | Controlled by on-chain governance         |
| Team & advisors       | 15% | 150M   | 4-year cliff + monthly (beginning year 2) |
| Strategic investors   | 12% | 120M   | 2-year lock, 1-year linear                |
| Liquidity & launchpad | 8%  | 80M    | Initial DEX offering + MM reserves        |

## Fee Flow & Value Accrual

Every transaction on Layer  $\infty$  generates fees (paid in `SDECR` or any token, auto-converted):

- 60% of fees  $\rightarrow$  stakers (in `SDECR`)
- 20%  $\rightarrow$  DAO treasury
- 20%  $\rightarrow$  burned (deflationary mechanism)

**Projected annual fee volume year 1:** \$50M+ (based on \$240M TVL managed across partners)

## VI. USE CASES (NARRATIVE FORM)

### Use Case 1: The Gamer

> **Maya** plays three different blockchain games. In Game A, she has rare armor. In Game B, she has land. In Game C, she has a guild badge.

> **Before DeCruiz:** Each asset is trapped. She cannot sell the armor to buy land. She cannot use the land as collateral for a loan to buy more badges.

> **With DeCruiz:** She opens her unified wallet. Sees all assets across all games. Lists the armor on the cross-game marketplace. Receives payment in stablecoins. Uses those stablecoins to make an offer on land in Game B — all in one transaction, under one second, verified by ZK.

### Use Case 2: The DeFi Power User

> **Carlos** has \$50k in a lending pool on Arbitrum. He also owns a tokenized warehouse in Texas (RWA). He wants to leverage his RWA to increase his lending position.

> **Before DeCruiz:** He would need to exit his Arbitrum position, bridge funds, find an RWA-friendly lender, likely on a different chain, and pay high fees.

> **With DeCruiz:** He deposits the warehouse token as collateral in the DeCruiz DEX (cross-chain). Receives a stablecoin loan on Arbitrum \*without leaving the chain\*. His original lending position remains intact.

## Use Case 3: The Real Estate Developer

> **Nina** tokenizes a 20-unit apartment building. She wants to sell fractional shares globally but comply with US and EU securities laws.

> **Before DeCruiz:** She would need separate token contracts on separate chains, separate KYC, separate marketplaces.

> **With DeCruiz:** One token on Layer  $\infty$ . Compliance oracles restrict trading per jurisdiction. Investors use their DeCruiz DID (with KYC proof) to buy fractions. Yield is distributed automatically across all holders, regardless of which chain they hold the token on.

## VII. ROADMAP: FROM ARCHIPELAGO TO CONTINENT

| Phase   | Timeline   | Milestone                                         |
|---------|------------|---------------------------------------------------|
| Phase 0 | Q4 2024    | Research & ZK bridge prototypes                   |
| Phase 1 | Q1–Q2 2025 | Testnet launch (EVM only)                         |
| Phase 2 | Q3–Q4 2025 | <b>Mainnet live</b> — DEX, identity layer, DAO    |
| Phase 3 | Q1 2026    | Scroll partnership, GameFi SDK                    |
| Phase 4 | Q2 2026    | RWA engine — first tokenized property             |
| Phase 5 | Q2 2026    | Solana integration, mobile wallet                 |
| Phase 6 | Q2 2026    | Cross-chain liquidity aggregator v2               |
| Phase 7 | 2027       | DAO-controlled chain expansion (Aptos, Sui, etc.) |

**Current status (March 2026):** Phase 4 — RWA engine live, first property in progress.

## VIII. SECURITY & RISK

### Mitigations, Not Denials

| Risk                         | Probability | Mitigation                                                                             |
|------------------------------|-------------|----------------------------------------------------------------------------------------|
| Bridge exploit               | Medium      | ZK-proof verification + MPC threshold signatures + daily on-chain audits               |
| RWA legal challenge          | Medium      | Compliance oracles + legal wrapper DAO + jurisdiction-specific fractionalization       |
| Liquidity bootstrapping      | Low         | \$4.2M treasury allocated to liquidity mining                                          |
| Smart contract vulnerability | Low         | 4 independent audits (Trail of Bits, Zellic, Code4rena, Sigma Prime) + \$2M bug bounty |
| Centralization risk          | Low         | All protocol contracts upgradeable only by DAO with 14-day timelock                    |

### Insurance Fund

The DAO maintains an **insurance fund** (currently \$1.2M in USDC) to cover:

- Bridge failures (up to \$10M per incident)
- Oracle manipulation
- RWA legal disputes

## IX. COMPETITIVE LANDSCAPE

| Protocol       | Strength                       | Weakness vs DeCruiz             |
|----------------|--------------------------------|---------------------------------|
| LayerZero      | Widely adopted                 | No native RWA or GameFi focus   |
| Wormhole       | High security                  | Complex UX, no unified identity |
| Axelar         | General purpose                | Slower (<10s latency)           |
| Chainlink CCIP | Oracle + messaging             | Expensive, not asset-native     |
| DeCruiz        | Unified ID + RWA + Gaming + ZK | Newer ecosystem (scaling)       |

### DeCruiz differentiators:

- Only protocol with **native RWA compliance oracles**
- Only protocol with **gasless, MPC wallet across all chains**
- Only protocol with **quadratic DAO + grants system built in**

## XII. APPENDIX

### A. Glossary

| Term           | Definition                                                |
|----------------|-----------------------------------------------------------|
| MPC            | Multi-Party Computation — split key without single holder |
| ZK             | Zero-Knowledge — prove truth without revealing data       |
| RWA            | Real-World Asset — off-chain value tokenized on-chain     |
| Layer $\infty$ | DeCruiz protocol name (infinite composability)            |
| Gasless        | Transaction fees paid by relayer or in any token          |

## C. Legal Disclaimer

**This whitepaper is for informational purposes only. DeCruiz Labs does not guarantee any future performance. Token distribution (if any) will be announced via official channels. Always DYOR.**

# XIII. CONCLUSION: THE INVITATION

We have laid the foundation. The DAO is voting. The bridge is live. The first real estate token is weeks away.

But a continent is not built by one team.

**This is an open invitation:**

- **To gamers:** Bring your items. We'll make them wander.
- **To DeFi natives:** Bring your liquidity. We'll make it borderless.
- **To real estate owners:** Bring your buildings. We'll make them liquid.
- **To developers:** Bring your dApps. We'll give them a unified identity layer.

*The open internet was always supposed to be one place. DeCruiz Labs is just finishing the job.*

**Join the DAO. Shape the continent.**

**End of Whitepaper v2.0**

**DeCruiz Labs — Build without borders.**
